BAMBINOS.LIVE

AI CLASSROOM CONTENT MINING & AD CREATIVE PIPELINE

AI Program Manager (Marketing) | Take-Home Case Report

THE PROPOSAL

A human-in-the-loop workflow that uses timestamped transcripts to identify authentic learning moments, score and screen them, verify them against video, and prepare editor-ready advertising briefs - while keeping child privacy and consent as release gates.

4	3	5
real sessions analysed	candidate briefs prepared	rejected segments documented

Prepared for the Bambinos.live AI Program Manager (Marketing) hiring assessment

Prepared from the supplied assignment brief, project handover, populated tracker workbook, system prompt and tracker screenshots. External market references checked on 05 November 2026.

Status: Prototype and case-report submission. Not a production deployment or an advertisement clearance document.

1. Executive Summary

Bambinos.live needs a repeatable way to identify short, parent-relevant moments from long live-class recordings without asking marketing staff and editors to scrub every minute of every session. The assessment brief describes a manual bottleneck in which teams review roughly 50-minute classes to find only a small number of potentially usable clips, while many sessions yield none. It also states that 85-90% of current manual review time is wasted. [1]

This submission proposes a transcript-first, human-in-the-loop content-mining pipeline. A versioned system prompt scans timestamped WebVTT transcripts, classifies learning moments, preserves exact dialogue, proposes a 3-second hook, applies a 10-point rubric and raises hard-exclusion flags. Candidate records are stored in a Google Sheets tracker. A human reviewer then checks the corresponding recording for audio, visuals, mute readability, context, privacy and teacher tone. Only after consent and compliance approval can an editor turn a brief into an advertisement.

What the sample analysis produced

Subject / session	Result in tracker	What it demonstrates
English / 2125604619	ENG-001; 6/10; Creative Expression	Child imaginative response; below the prompt 7/10 threshold, so treat as review-only exception.
Gita / 2125422751	GIT-001; 7/10; Aha Moments	Child explains a prayer-related meaning; cultural context and consent review remain required.
Maths / 2125736982	No selected candidate; 4 hard rejections	Negative teacher tone and private family information justify segment-level rejection.
Science / 2125687282	SCI-001; 7/10; Interactive Learning; plus 1 rejection	Tractor/farming exchange; unclear transcript wording requires audio confirmation. A separate name-and-age segment is rejected.

DECISION STATUS

The three creative briefs are prepared for review, not approved for advertising. All three candidates are marked “Needs Review” in the tracker. Guardian marketing consent and outstanding compliance checks are release gates.

Key recommendation

Pilot this workflow with a small weekly batch before scaling to 500 classes per week. Do not optimise for the number of clips extracted. Optimise for editor-accepted, safe, contextually accurate clips and for the time saved without increasing privacy or quality failures.

2. Problem Audit

Current bottleneck

- Input volume: long live-class recordings (the assignment describes approximately 50-minute sessions) plus timestamped WebVTT transcripts. [1][3]
- Manual discovery: marketing staff and editors scrub recordings to locate short 10-20 second moments that show participation, understanding or other parent-relevant value.
- Low-yield sessions: some classes produce no usable advertising moment; the brief estimates 85-90% of manual review time is wasted. [1]
- Review gap: transcripts contain words and timestamps, but cannot prove who is visible, whether an activity is happening on-screen, whether audio is clean, or whether personal information appears in the video.
- Risk: an engaging-sounding exchange may still be unsuitable due to child distress, teacher shaming, PII, missing consent or misleading edits.

Root causes and corresponding controls

Root cause	Operational consequence	Proposed control
Unstructured discovery	Reviewers use inconsistent judgement and may overlook strong moments.	Shared taxonomy, structured prompt output and a single tracker.
Transcript-only evidence	Candidate may have no usable visual/audio context.	Mandatory source-video inspection before brief handoff.
No explicit safety gate	High-scoring material may still be unsuitable.	Hard exclusions override all numerical scores.
Inconsistent handoff	Editors may not know hook, exact dialogue or cut boundaries.	Standard Ad Creative Brief with source timecodes and editing notes.
No feedback loop	False positives and missed moments are not systematically learned from.	Editor accept/reject reasons, QA sampling and weekly prompt calibration.

Scope and assumptions

This is a prototype workflow designed around the four official sample sessions. It is not a built production application, an integrated automation, or a proof of 10x improvement. Any time-saving and cost estimates later in this report are illustrative planning scenarios and must be replaced by time-study data during the pilot.

3. Market and Creative Research

The market scan combines current official brand positioning with publicly surfaced creative examples and third-party Meta Ad Library aggregations. Across the category, brands commonly make a parent-visible learning benefit concrete, show the learning format or a child-created output, and invite parents to book a free class. These are observable creative patterns and testing hypotheses; publicly available ad records do not establish which creative actually converted parents.

Brand and competitor positioning

Brand	Public positioning observed	Implication for moment-led ads
Bambinos.live	Current official positioning: curiosity-led learning experiences, live 1:1 and small-group classes (up to six), and a Spark–Stretch–Solve–Share learning arc. The site invites parents to book a free class. [13][14]	Use authentic footage of a child asking, reasoning, explaining or creating. Show the learning behaviour as evidence instead of relying on a broad claim.
PlanetSpark	Promotes live public-speaking, creative-writing and English communication programmes, with free-trial calls to action. Public Meta-ad-library aggregation shows recurring public-speaking category hooks and video-heavy creative. [5][15]	Communication and confidence are prominent parent-facing angles. Show a child speaking, presenting or expressing an idea, with the context that makes the skill observable.
Bhanzu	Promotes live, small-group maths classes using real-world questions, concept-first learning and problem solving; its class page uses a shopping/percentages question and a free-demo CTA. A public parent-content example uses “Mumma, what comes next?” [6][17][18]	Lead with a relatable question, then show the child’s reasoning or discovery. Treat parent-story and curiosity hooks as creative references, not proof of results.
BrightCHAMPS	Promotes live coding and future-skills programmes for ages 6–16, hands-on apps/games and free trial sessions. Public Meta-ad-library aggregation reports recurring “CODING FOR KIDS” hooks and a substantial video mix. [7][16][19]	For abstract skills, show a tangible child-created project or action. A visible output can help a parent understand what the class experience involves.

Public ad-creative signals (directional, not performance proof)

- PlanetSpark: a third-party gallery of public Meta Ad Library records (snapshot updated 12 August 2026) reports 1,989 ads, with 78% video creative; repeated hooks include “PUBLIC SPEAKING FOR KIDS” and “PUBLIC SPEAKING = POWER”. It also records free-trial-class calls to action. These are counts and classifications from the aggregator, not Meta-reported conversion outcomes. [15]
- Bhanzu: its official maths-class page opens with a real-world question (“What would shopping look like without percentages?”) and describes a brainstorm → concept → problem-solving → cliffhanger lesson flow. A public Bhanzu parent-story post uses “Mumma, what comes next?” as a curiosity-led social hook. The social example cited is LinkedIn content, not an Instagram Reel or verified paid ad. [17][18]
- BrightCHAMPS: a third-party gallery of public Meta Ad Library records (snapshot updated 12 August 2026) reports 3,053 ads, a 52% video share, and repeated “CODING FOR KIDS” hooks; the gallery also reports free-class CTAs. Its official coding page foregrounds apps, games and hands-on projects. Aggregator categories are directional, not conversion evidence. [16][19]

RESEARCH LIMITATION

The native Meta Ad Library is dynamic; this review could not capture a complete, reproducible set of individual ads directly from its interface. The competitor ad counts above come from third-party aggregations of public Meta Ad Library records and are date-stamped snapshots. The Bhanzu social example is a public LinkedIn post, not an Instagram Reel. No source provides reliable CTR, lead quality, enrolment conversion, ROAS or causal proof that a hook converts parents. Direct Meta Ad Library search links are included in the references for a fresh manual check before campaign planning.

Creative principles to test

- Lead with a specific question, surprising answer or visible action within the first three seconds.
- Connect the moment to a parent-relevant benefit: expression, curiosity, reasoning, creative thinking or participation.
- Use accurate captions for sound-off viewing; do not rewrite a child’s words to make the clip cleaner.
- Preserve teacher-child context and avoid unverified outcome claims, emotional manipulation or cultural overstatement.

4. Moment Taxonomy and Scoring Rubric

The six categories in the system prompt are retained as the shared taxonomy. The primary category should describe the learning behaviour visible or audible in the moment, not merely the subject being taught. [2]

Bucket	Definition used in this workflow	Possible evidence
Aha Moments	Child demonstrates understanding or explains a concept in their own words.	A child explains what something means or why an answer works.
Curiosity Moments	Interesting question, unexpected discovery or curiosity.	A child asks “why/how/what if?” or notices something new.
Problem-Solving	Child solves a puzzle, challenge or problem.	A visible reasoning step, attempt, correction or solution.
Creative Expression	Storytelling, original ideas, imagination or communication.	A child invents, describes, imagines or communicates an original idea.
Interactive Learning	Games, experiments, visual activities and teacher-child interaction.	A real-time activity, demonstration, question or response.
Confidence Moments	Child volunteers, attempts a challenge or responds positively to feedback.	A child speaks up, tries again or shares an answer.

Ten-point rubric

Criterion	Points	Scoring guidance
Parent learning value	0-2	0: no clear parent-relevant value; 1: some relevant skill/value; 2: clear demonstrated learning value.
Scroll-stopping hook	0-2	0: weak opening; 1: understandable but ordinary; 2: specific, compelling question/action/answer.
Child participation	0-2	0: passive or absent; 1: limited participation; 2: active child contribution.
Positive authentic emotion	0-1	1 only where positive, natural emotion is evident; otherwise 0.
Visual potential	0-1	1 when the recording visibly supports the moment and edit.
Audio clarity	0-1	1 when relevant speech is intelligible and usable.
Sound-off readability	0-1	1 when meaning can be communicated with accurate captions/visuals.

SHORTLIST THRESHOLD

The system prompt states that a candidate scoring 7/10 or higher may be shortlisted only when no hard exclusion applies. A score is not an approval. A hard exclusion overrides the total.

Important scoring consistency note

ENG-001 is 6/10 in the tracker. It is included in this sample brief set because it was retained in the project shortlist, but it is below the prompt’s stated 7/10 threshold. For strict prompt compliance, it should be labelled “below threshold - review-only exception” and not treated as a score-qualified shortlist pass. GIT-001 and SCI-001 each score 7/10. No existing tracker value has been changed in this report.

The tracker uses the formula =IF(COUNT(J2:P2)=7,SUM(J2:P2),"") so the total is calculated only when all seven numeric scoring fields are present. Rejected rows have blank numeric scoring components in the uploaded workbook.

5. Proposed Workflow Architecture

The workflow combines automation for repetitive transcript screening with explicit human decision gates for the parts that require judgement, video context and child-safety review.

Human approval is a mandatory gate before production or paid distribution.

Stages, inputs and outputs

Stage	Input	Output / control
1. Recording complete	Original class MP4 and session metadata.	Recording reference, subject and session ID.
2. Transcript available	Timestamped WebVTT.	Transcript retained as source of truth for spoken text/timecodes.
3. AI moment mining	Transcript + versioned system prompt.	Candidate windows, category, hook draft, exact dialogue, preliminary scores and flags.
4. Tracker population	Structured AI output.	One row per candidate/rejection; formulas, dropdowns, filters and status fields.
5. Human verification	Candidate timecodes + original video.	Verified/rejected/needs-review status; audio, visual, mute-readability, context and privacy checks.
6. Editor handoff	Approved-for-edit brief only.	10-20 second clip brief, cut instructions, captions and proposed hook.
7. Marketing approval	Edited creative + consent evidence + compliance review.	Approved, revise or rejected decision; only approved assets proceed to distribution.

Current prototype versus proposed scale-up

Capability	What is evidenced in this submission	What is proposed, not yet built
AI analysis	A written system prompt and transcript-based analysis of all four sessions.	Repeatable batch runs, structured output validation and prompt version registry.
Tracking	Google Sheets tracker with 22 business columns, score formula, filters/dropdowns and visual verification/status fields.	Automated transcript ingest, row creation, change log and reviewer notifications.
Video QA	Manual inspection status recorded as “Verified - Pass” for the three candidates by the project owner.	Reviewer assignment, timestamped QA evidence and sampled second-review workflow.
Automation	No production integration or deployed agent is claimed.	Optional no-code orchestration (e.g., n8n/Make) and API integration after a controlled pilot.

6. End-to-End Standard Operating Procedure (SOP)

A. Intake and transcript preparation

1. Register each completed class with session ID, subject, recording location, recording duration and transcript file name.
2. Check that the WebVTT file opens, contains timestamps and corresponds to the correct session. Do not substitute a different transcript or infer missing text.
3. Keep the original MP4 and VTT unchanged. Work from copies or references; retain source links and access permissions.

B. AI transcript screening

4. Run the approved, versioned content-mining prompt on the full transcript. Include the subject, session ID, taxonomy and scoring rubric.
5. Request 10-20 second candidate windows with exact start/end timestamps and verbatim dialogue. Ask the model to combine adjacent cues only when needed to preserve context.
6. Apply the six moment buckets and record one primary category. Generate a proposed parent-facing hook separately from source dialogue.
7. Reject or flag privacy, distress, teacher-shaming, private-information and other hard-exclusion content. Do not force a minimum number of candidates.

C. Tracker and scoring

8. Populate one row per candidate or significant rejected moment. Preserve original timestamps and verbatim wording; anonymise any identity detail.
9. Score the seven rubric criteria. Keep a score blank if evidence is missing; do not convert “pending” into zero.
10. Use the total formula only when all seven score fields are numeric. Enforce the 7/10 shortlist rule and label any exception explicitly.

D. Human video verification and approval

11. Open the original video at the candidate timecode and inspect enough context before and after the cut to understand the exchange.
12. Verify who is visible, whether the activity is visible, whether audio matches the transcript, whether any overlap/noise exists and whether captions can make the moment understandable on mute.
13. Check for names, ages, addresses, school details, contact information, private family information, private screens and signs of distress or discomfort.
14. Check documented guardian/marketing consent and any market-specific restrictions. If consent is missing or unclear, hold the candidate; do not send it to paid advertising.

E. Editor handoff and release

15. Create the standard brief with hook, exact source dialogue, source timestamps, parent value, bucket, score, geography hypothesis, flags and concrete edit instructions.
16. The editor returns a cut for factual, caption, privacy and context review. Marketing/compliance owner approves or requests changes.
17. Only an approved creative with documented consent can move to paid distribution. Record editor acceptance/rejection and the reason in the tracker.

7. Results Across the Four Sessions

The table below reflects the uploaded tracker workbook and the project handover. All four official sessions were analysed; the workflow did not force a selected candidate from every class.

Subject	Session ID	Selected candidate	Rejected segments	Result
English	2125604619	ENG-001 (17.040s; 6/10)	0 recorded in tracker sample	Creative expression; retain only as below-threshold review exception.
Gita / Little Yogi	2125422751	GIT-001 (13.661s; 7/10)	0 recorded in tracker sample	Aha moment; language and cultural context need audio/context review.
Maths	2125736982	None	4 (MATH-REJ-001 to 004)	Zero selected candidate; teacher-tone and private-family-information exclusions.
Science	2125687282	SCI-001 (17.950s; 7/10)	1 (SCI-REJ-001)	Interactive-learning candidate plus a separate child-identifying-information rejection.

Selected candidate score breakdown

Candidate	Parent value	Hook	Participation	Emotion	Visual	Audio	Mute	Total
ENG-001	1	1	2	0	1	1	0	6/10
GIT-001	1	1	2	0	1	1	1	7/10
SCI-001	1	1	2	0	1	1	1	7/10

Verification and data-quality notes

- The tracker marks ENG-001, GIT-001 and SCI-001 as “Verified - Pass” for visual verification. The project handover also states that manual video verification was completed. This report records that status as supplied; the recording files were not independently re-reviewed during PDF authoring.
- All three candidate decisions remain “Needs Review.” This is appropriate because video verification is not the same as consent or advertising clearance.
- The Science candidate transcript contains an unclear word. The exact tracker text preserves “[unclear]”; the editor must confirm the audio before captions are finalised.
- The Gita transcript includes uncertain transliteration/spelling (“nammas” / “namas”). Preserve source wording until verified against the recording; do not silently correct it.
- The uploaded workbook has blank numeric score fields for the five hard-rejected records, consistent with the stated score-cleanup instruction.

8. Ad Creative Brief 01 - ENG-001

STATUS: NEEDS REVIEW | 6/10 - BELOW THE 7/10 PROMPT THRESHOLD

This brief is retained as a review-only example because it appears in the project shortlist. It must not be described as a score-qualified pass unless the rubric threshold is formally revised and documented.

Field	Brief detail
Candidate / session	ENG-001 | English | Session 2125604619
Source window	00:09:56.139 - 00:10:13.179 | 17.040 seconds
Moment bucket	Creative Expression
Tracker score	Parent value 1; hook 1; participation 2; emotion 0; visual 1; audio 1; mute readability 0; total 6/10.
Proposed 3-second hook	“What animals did you imagine at the beach?” (Proposed ad copy, not classroom dialogue.)
Verbatim dialogue in tracker	Child: crabs, a seaweed, octopus. Teacher: octopus also you saw all.
Parent-facing value	An example of a child sharing imaginative ideas and using spoken language in an interactive English-class exchange.
Geography fit	Uncertain, as recorded in tracker. Do not infer the child’s location or market from the dialogue.
Compliance flags	Guardian consent required; transcript and surrounding context need review.
Visual verification	Verified - Pass in the tracker; this report relies on the project owner’s recorded verification status.
Final decision	Needs Review. Below the prompt’s stated 7/10 shortlist threshold.
Editor instructions	Inspect the original video and surrounding context. Retain the relevant teacher prompt and child response. Confirm exact captions, check identity/privacy, avoid misleading cuts and do not publish until consent and compliance are cleared.

Creative treatment: use the child’s imagination as the proof point. Keep the opening question and response together so the viewer understands the exchange. The current mute-readability score is 0, so a sound-off edit needs a stronger caption/visual treatment and should be re-evaluated rather than assumed to pass.

9. Ad Creative Brief 02 - GIT-001

STATUS: NEEDS REVIEW | 7/10

Score meets the prompt's numeric shortlist threshold, but consent and cultural/context checks remain release gates.

Field	Brief detail
Candidate / session	GIT-001 | Gita (Little Yogi) | Session 2125422751
Source window	00:47:01.679 - 00:47:15.340 | 13.661 seconds
Moment bucket	Aha Moments
Tracker score	Parent value 1; hook 1; participation 2; emotion 0; visual 1; audio 1; mute readability 1; total 7/10.
Proposed 3-second hook	"Can your child explain the meaning behind what they learn?" (Proposed ad copy, not classroom dialogue.)
Verbatim dialogue in tracker	Teacher: It means that we are saying nammas to God is Saraswati, right? What are we doing? Child: Say namas, Namaste to the God.
Parent-facing value	Shows a child participating in a discussion about the meaning behind a prayer, rather than presenting the exchange as simple repetition.
Geography fit	India; GCC subject to audience targeting, as recorded in tracker. This is a creative hypothesis, not a conversion prediction.
Compliance flags	Religious and cultural context review required. Parental marketing consent must be confirmed. Child identity must be anonymised. Verify exact spoken dialogue against audio.
Visual verification	Verified - Pass in the tracker; this report relies on the project owner's recorded verification status.
Final decision	Needs Review.
Editor instructions	Retain teacher question and child explanation together. Confirm transliteration and exact wording against the recording. Do not add religious interpretation, outcome claims or dramatic treatment that changes the meaning. Maintain respectful cultural context and anonymise the child.

Creative treatment: focus on the child's explanation and the learning conversation. Any caption or narration must be grounded in the actual spoken words. The source transcript contains possible recognition/transliteration errors; audio confirmation is mandatory before final edit.

10. Ad Creative Brief 03 - SCI-001

STATUS: NEEDS REVIEW | 7/10

Score meets the prompt's numeric shortlist threshold, but unclear transcript wording and consent checks remain open.

Field	Brief detail
Candidate / session	SCI-001 | Science | Session 2125687282
Source window	00:04:57.939 - 00:05:15.889 | 17.950 seconds
Moment bucket	Interactive Learning
Tracker score	Parent value 1; hook 1; participation 2; emotion 0; visual 1; audio 1; mute readability 1; total 7/10.
Proposed 3-second hook	"What can a tractor do on a farm?" (Proposed ad copy, not classroom dialogue.)
Verbatim dialogue in tracker	Teacher: "What does the tractor do?" Child: "Tractor will [unclear] the soil and put the seeds and put the soil and put water..."
Parent-facing value	Shows a teacher-child exchange about a real-world farming activity and a child attempting to explain what a tractor does.
Geography fit	Uncertain, as recorded in tracker.
Compliance flags	Guardian consent required; transcript wording unclear; verify original audio and visuals; check that no child-identifying details appear in the frame.
Visual verification	Verified - Pass in the tracker; this report relies on the project owner's recorded verification status.
Final decision	Needs Review.
Editor instructions	Review original video around 00:04:55-00:05:20. Confirm the tractor/farming visual and the child's answer. Do not guess the unclear word or create captions until audio is checked. Retain teacher question and child response together; inspect frame for identifying details.

Creative treatment: the hook and learning value should be carried by the question/answer exchange. Avoid inserting illustrative footage that falsely implies an activity occurred on-screen. Do not replace "[unclear]" with a guessed word.

11. Rejected Moments and Hard-Exclusion Evidence

A safe content-mining workflow must be willing to return zero candidates. These five segments were recorded as hard rejections in the uploaded tracker. The segments are rejected individually; this does not automatically invalidate the entire subject session.

Candidate	Session / timecode	Reason recorded	Disposition
MATH-REJ-001	2125736982 | 00:25:17.240-00:25:31.329	Teacher shaming / insulting language and negative tone.	Reject segment; never repurpose as an ad.
MATH-REJ-002	2125736982 | 00:37:40.500-00:37:57.639	Belittling language and negative teacher tone.	Reject segment; never repurpose as an ad.
MATH-REJ-003	2125736982 | 00:45:43.809-00:46:04.349	Threat of a zero score and criticism of the child's answers.	Reject segment; never repurpose as an ad.
MATH-REJ-004	2125736982 | 00:47:48.800-00:48:03.579	Negative teacher tone and private family information.	Reject and do not reproduce private family references.
SCI-REJ-001	2125687282 | 00:35:50.539-00:36:05.230	Child-identifying information requested (name and age).	Reject segment; remove/avoid all identifying details.

Hard-exclusion policy

- Reject or escalate child PII, private family details, embarrassment, distress, fear or discomfort.
- Reject teacher shaming, threatening, insulting, humiliating or otherwise negative teacher-child interactions.
- Reject unverified outcome claims, fabricated or materially altered dialogue and private information on shared screens or in recordings.
- Missing or undocumented guardian marketing consent blocks advertising release. A high score cannot override a hard exclusion.
- Do not reproduce names, ages, school/location/contact details or private family information in the case report, editor brief or public repository.

WHY ZERO IS AN ACCEPTABLE OUTPUT

The Maths session produced no selected advertising candidate in this sample. That is a valid outcome and demonstrates that the pipeline prioritises safety and brand trust over filling a quota.

12. Performance Metrics and Unit Economics

Operational KPIs

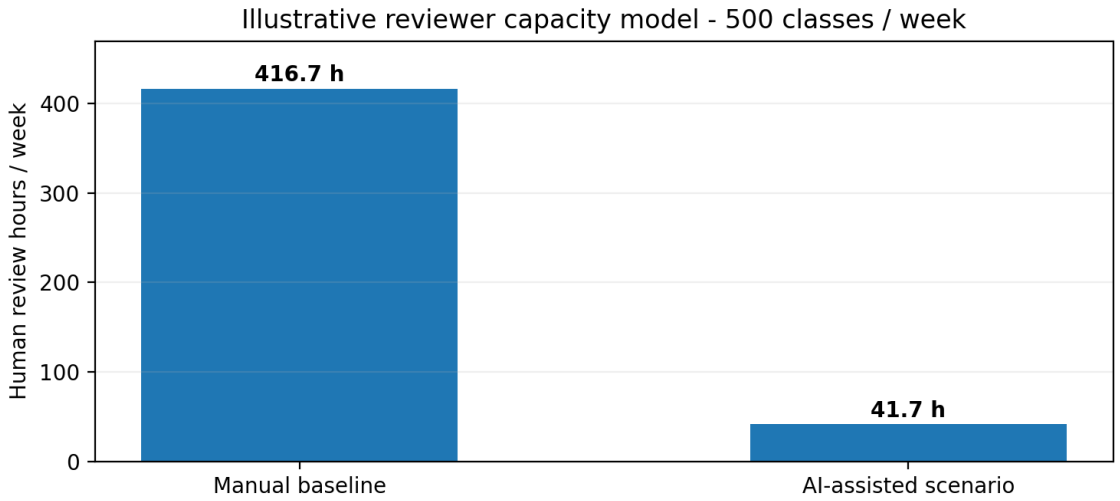

Metric	Definition	Pilot measurement / proposed target
Reviewer hours per 100 classes	Total human hours from transcript triage through video QA and brief handoff.	Measure a manual baseline in weeks 1-2; propose >=50% reduction by day 30 and >=80% by day 90.
Candidate yield	Number of candidate windows per 100 class recordings.	Track by subject; no minimum quota and no target to force clips.
Editor acceptance rate	Briefs editors accept for editing divided by briefs handed off.	Establish baseline; proposed >=70% by day 60 and >=75% by day 90.
False-positive rate	AI-selected candidates rejected by human reviewers/editors divided by AI candidates reviewed.	Track rejection reason; proposed <=25% by day 60 and <=20% by day 90.
Hard-exclusion recall	Known privacy/teacher-tone test cases correctly blocked.	Target 100% detection on the curated test set; audit every escape.
Consent completeness	Candidates with documented required marketing consent before release.	100% before paid distribution.
Brief completeness	Handoffs with source timecodes, exact dialogue, hook, score, bucket and editor notes.	Target 100% complete before editor queue.
Time to editor-ready brief	Elapsed time from class completion to reviewed brief.	Baseline first; proposed service-level target within 24 hours for in-scope sessions.

Illustrative 500-class/week model

The assignment asks for a 500-class/week scenario. Actual staff time, wage rate, candidate yield, AI usage and approved-clip yield were not provided. The following numbers are planning assumptions to make the unit economics transparent, not measured project results.

Assumption	Manual baseline	AI-assisted scenario
Class volume	500 per week	500 per week
Class duration	50 minutes	50 minutes
Human effort assumption	50 minutes reviewer time per class (one full manual pass).	2 min triage per class + 1 min admin/QA per class + 10 min video verification for 20% of classes.
Reviewer hours	416.7 hours/week	41.7 hours/week
Reviewer cost assumption	₹300/hour	₹300/hour
AI/tool cost assumption	₹0 incremental in manual baseline for comparison.	₹5 per class = ₹2,500/week; illustrative budget placeholder, not vendor pricing.
Total weekly cost	Approx. ₹125,000	Approx. ₹15,000
Candidate output assumption	20% of classes yield candidates; 1.5 candidates per yielding class = 150/week.	Same output assumption; this is not an approval count.
Cost per candidate brief/clip opportunity	Approx. ₹833	Approx. ₹100

13. Unit Economics - Calculation and Interpretation

Calculation

- Manual reviewer hours = 500 classes x 50 minutes / 60 = 416.7 hours per week.
- AI-assisted reviewer hours = (500 x 2 minutes triage + 500 x 1 minute admin/QA + 100 candidate-bearing classes x 10 minutes video verification) / 60 = 41.7 hours per week.
- Manual labour cost = 416.7 x ₹300 = approximately ₹125,000/week.
- AI-assisted cost = (41.7 x ₹300) + (500 x ₹5 illustrative tooling allowance) = approximately ₹15,000/week.
- Assumed candidate output = 500 x 20% candidate-bearing sessions x 1.5 candidate moments = 150 candidate opportunities/week.
- Illustrative cost per candidate = weekly workflow cost / 150 = approximately ₹833 manual versus ₹100 AI-assisted.

Interpretation and limitations

Under these assumptions, human review hours fall by about 90% (416.7 to 41.7 hours), equivalent to roughly 10x more classes screened per reviewer-hour. The model shows an approximately 88% lower cost per candidate opportunity. These are scenario outputs, not achieved savings.

The assignment brief mentions 85-90% of current manual review time being wasted, but it does not provide a measured reviewer minutes-per-class figure, wage rate, AI bill or actual accepted-candidate yield. The model therefore uses explicit editable assumptions. The 20% candidate-bearing-session rate and 1.5 candidates per such session must be replaced by pilot data.

IMPORTANT DISTINCTION

A “candidate opportunity” is not the same as an approved advertisement. The true cost per approved usable ad clip must be calculated as total workflow cost divided by the number of final clips that pass editor QA, consent, privacy/compliance review and marketing approval.

Sensitivity formula for the business owner

Cost per approved/usable clip = (reviewer hours × fully loaded hourly cost + AI/tooling + editing/QA allocation) ÷ final approved clips. The following sensitivity table illustrates how the result changes with an assumed approval yield. Editing/production costs are excluded because no rate was supplied; replace every assumption with pilot data before budgeting.

Assumed candidate-to-approved yield	Approved clips/week (from 150 opportunities)	Manual cost per approved clip	AI-assisted cost per approved clip
20%	30	₹4,167	₹500
40%	60	₹2,083	₹250
60%	90	₹1,389	₹167

14. 30-60-90 Day Rollout Plan

Period	Focus and actions	Exit criteria / proposed gates
Days 1-30 | Pilot and establish baseline	Pilot on a controlled batch (e.g., 50-100 classes). Finalise prompt v1.1, tracker definitions and the hard-exclusion checklist. Train one marketer, one editor and one reviewer. Log manual time, AI-assisted time, editor acceptance and all false positives. Audit every candidate and a sample of zero-candidate sessions.	Baseline time study complete. 100% of candidate rows have source timestamps and compliance fields. 100% of hard-exclusion test cases are blocked. No clip released without consent evidence. Target >=50% reviewer-time reduction, subject to baseline.
Days 31-60 | Standardise and automate intake	Expand only if pilot quality gates pass. Automate transcript file intake and structured row creation using an approved workflow tool. Add prompt/version control, duplicate detection, reviewer ownership and reason codes. Review editor feedback weekly and recalibrate the rubric. Test separate India/GCC/International creative hypotheses without inferring child identity.	Target >=70% reviewer-time reduction and >=70% editor acceptance. False-positive rate proposed <=25%. All overrides and prompt changes logged. No unresolved privacy incident.
Days 61-90 | Scale with governance	Scale toward 500 classes/week only after queue capacity, consent workflow, QA sampling and cost model are proven. Introduce weekly dashboards, drift review, random second-review samples, incident escalation and monthly prompt governance. Connect creative test metrics (3-second hold, hook rate, CTR, qualified lead/enrolment metrics) to approved ad IDs where available.	Target >=80% reviewer-time reduction and >=75% editor acceptance. Proposed false-positive rate <=20%. 100% consent completeness before distribution. Cost per approved clip measured from actual data and compared with baseline.

Adoption plan

- Co-design the brief template with editors; remove fields that do not change the edit decision, but keep privacy/consent gates mandatory.
- Use a weekly 30-minute review: show accepted examples, rejected examples, false positives and missed moments.
- Give reviewers a simple “accept / revise / reject” control plus standard rejection reasons (audio, visual, context, hook, score, privacy, consent, brand fit).
- Keep a human override path, but log who overrode what and why. Do not train the process to maximise candidate volume.

15. Risk, Privacy and Human Approval Controls

Risk	Control	Owner / evidence
Child identity or family PII exposed	Minimise data in prompts and briefs; anonymise candidate references; inspect frames, shared screens and captions; redact identifiers from public outputs.	Reviewer + privacy/compliance owner; recorded checklist.
Missing guardian marketing consent	Consent is a hard release gate. Hold the candidate until required consent is documented and linked to the asset.	Marketing/compliance owner; consent evidence reference.
Teacher shaming or child distress	Hard reject the segment; preserve only the minimum rejection reason needed for audit.	Reviewer; rejection code and timecode.
Transcript error or invented dialogue	WebVTT is the source for initial words/timecodes; video/audio check is mandatory; keep [unclear] until confirmed.	Reviewer/editor; verified caption proof.
Audio/visual mismatch	Verify camera state, visible action, audio quality and clip context in the source recording.	Video reviewer; verification status.
Misleading cut or outcome claim	Keep enough context to preserve meaning; do not imply academic or developmental results not proven by the footage.	Editor + marketing approver; final cut review.
Cultural/geography misfit	Review the subject, language, religious/cultural context and local parent audience; treat geography fit as a hypothesis.	Regional marketing reviewer; market-specific sign-off.
Model drift or inconsistent scoring	Version prompts; calibrate on labelled examples; audit false positives/negatives and reviewer overrides.	Program owner; version log and QA report.
Sensitive source material in public repo	Do not commit raw child videos, PII, private family references, credentials or consent records. Publish only safe, anonymised summaries and necessary outputs.	Repository owner; pre-publish privacy check.

Human approval gates

18. Transcript candidate created - AI output is provisional.
19. Video verification passed - source visuals/audio/context inspected by a human.
20. Consent and compliance cleared - evidence is documented, with no unresolved hard exclusion.
21. Editor QA passed - captions, cut boundaries and claims accurately reflect the original class.
22. Marketing approval - only then may the final ad be considered for paid distribution.

16. Prototype Assets and Repository Handoff

Assets completed in this case

Asset	What it contains / status
AI Content Mining System Prompt v1.0	Role, objective, input rules, six-bucket taxonomy, hard exclusions, 10-point rubric, timestamp rules, geography hypothesis, audiovisual verification, structured output and rejection report.
Candidate Tracker workbook	22 business fields covering session/candidate data, timecodes, dialogue, seven rubric scores, geography, compliance, visual verification, final decision and editor instructions. Includes score formula, filters/dropdowns and formatted headers. The published repository copy has A1 corrected to “Session ID”; unused columns W:Z are blank. The original source workbook was left unchanged.
Four-session sample analysis	Three candidate moments plus five hard-rejected segments across English, Gita, Maths and Science.
Ad Creative Briefs	ENG-001, GIT-001 and SCI-001; all remain Needs Review. ENG-001 is explicitly below the 7/10 prompt threshold.
Workflow design	Documented transcript-first screening, tracker review, mandatory video verification, editor handoff and approval gates. A local n8n MVP has been drafted separately, but import and end-to-end execution have not been verified; it is not represented as a working automation in this case report.

Repository publication rules

- The public GitHub repository contains the compulsory Case Report PDF, README, exact prompt, candidate tracker, anonymised sample outputs, Ad Creative Briefs and workflow documentation. See the repository tree and `docs/submission_checklist.md`. [2]
- The current assignment prototype is prompt-and-tracker assisted, with manual audio-visual and compliance review. No tested n8n export, production application, API integration or end-to-end production automation is claimed in this report. Add any future automation export only after it has been imported, tested and documented.
- Do not upload original class videos, complete raw transcripts, child-identifying details, family information, consent documents, credentials or other restricted materials to a public repository. The source recordings and raw WebVTT files remain outside the published repository.
- For reproducibility, retain the input session IDs, prompt version, candidate tracker and scoring formula, candidate/rejection outputs, and the human video-verification and approval steps.

17. Conclusion and Decisions Requested

This prototype demonstrates a structured way to reduce the time spent searching long recordings while keeping safety and human judgement central. It analyses all four official sessions, identifies three moments for creative review, and records five segments that should not be used. The Maths session's zero-candidate result is intentional: the pipeline should protect children and brand trust even when that means returning no advertisement candidate.

The strongest next step is a controlled pilot with time tracking and editor feedback. The pilot should validate the assumptions in the 500-class economics model, resolve the ENG-001 threshold exception, and measure the proportion of candidates that survive video review, consent clearance and final marketing approval. Scaling should follow measured quality, not an assumed 10x claim.

Decisions before scale

- Confirm whether the 7/10 threshold is fixed. If yes, move ENG-001 to "below-threshold review example" rather than a qualified shortlist candidate.
- Assign an accountable owner for consent evidence and cultural/context review, especially for GIT-001.
- Define reviewer time tracking, editor acceptance reason codes and the first pilot sample size.
- Approve tool selection and a spending cap only after comparing measured time savings with AI/tool costs.

FINAL RELEASE RULE

No candidate in this report is approved for advertising. All three briefs are in "Needs Review" status. Final use requires documented guardian marketing consent, human review, accurate captions, privacy clearance and marketing approval.
